September 27, 2019

Notation. The probability measure for the Erdős-Rényi random graph $G(n, p)$ is denoted by $\mathbf{P}_{n,p}$ or \mathbf{P}_p .

Subsets of a base set S are sometimes denoted by $\omega \in \{0, 1\}^S$, thinking that $\omega(s) = 1$ iff $s \in \omega$.

The comparisons \sim, \asymp, \ll, \gg are used as agreed in class.

Bonus exercises are marked with a star. They can be handed in for extra points.

- ▷ **Exercise 1.** An event for the Erdős-Rényi random graph, $A \subset \{0, 1\}^{\binom{n}{2}}$, is called *upward closed* or *increasing* if, whenever $\omega \in A$ and $\omega' \supseteq \omega$, then also $\omega' \in A$. Show that, for any such event A , other than the empty or the complete set, the function $p \mapsto \mathbf{P}_p[A]$ is a strictly increasing polynomial of degree at most $\binom{n}{2}$, with $\mathbf{P}_p[A] = p$ for $p \in \{0, 1\}$. In particular, there exists a unique p such that $\mathbf{P}_p[A] = 1/2$; this value is usually called the *critical* (or *threshold*) *density*, and will be denoted by $p_c(n) = p_c^A(n)$.
- ▷ **Exercise 2.** Prove carefully that choosing M edges one-by-one between n vertices, always uniformly at random, independently of previous choices, but resampling the edge if a multiple edge was created, we get the model $G(n, M)$.
- ▷ **Exercise 3.** Find the order of magnitude of the critical density $p_c(n)$ for the random graph $G(n, p)$ containing a copy of the cycle C_4 . Same with K_4 . (Hint: as in class, use the 1st and 2nd Moment Methods.)
- ▷ **Exercise 4.** Let H be the following graph with 5 vertices and 7 edges: a complete graph K_4 with an extra edge from one of the four vertices to a fifth vertex. Show that if $5/7 > \alpha > 4/6$, and $p = n^{-\alpha}$, then the expected number of copies of H in $G(n, p)$ goes to infinity, but nevertheless the probability that there is at least one copy goes to 0. What goes wrong with the 2nd Moment Method?
- ▷ **Exercise 5.** Let $X_k(n)$ be the number of degree k vertices in the Erdős-Rényi random graph $G(n, \lambda/n)$, with any $\lambda \in \mathbb{R}_+$ fixed. Show that $X_k(n)/n$ converges in probability, as $n \rightarrow \infty$, to $\mathbf{P}[\text{Poisson}(\lambda) = k]$. (Hint: the 1st moment of $X_k(n)$ is clear; then use the 2nd moment method.)
- ▷ **Exercise 6.** Assume that $Y_n, n = 1, 2, \dots$, are non-negative integer valued random variables, with $\mathbf{E}[Y_n] \leq K < \infty$, independently of n . Show that $\text{Binom}(n - Y_n, \frac{\lambda}{n}) \xrightarrow{d} \text{Poi}(\lambda)$, as $n \rightarrow \infty$.
- ▷ **Exercise 7.** Prove that $1 - x \leq e^{-x}$ for all $x \in \mathbb{R}$, and $e^{-x} \leq 1 - x/2$ for all $0 < x < \epsilon$, if $\epsilon > 0$ is small enough. Conclude that, for any sequence $\epsilon_n \in (0, 1)$, we have: $\sum_n \epsilon_n = \infty \iff \prod_n (1 - \epsilon_n) = 0$.
- ▷ **Exercise 8.** Accepting the fact that if X_1, \dots, X_n are i.i.d. Cauchy variables, then the sum $S_n = X_1 + \dots + X_n$ has the distribution of nX_1 , show the following:
 - (a) $S_n/n \xrightarrow{P} 0$ does not hold.
 - (b) For any $\epsilon > 0$, the expected number of returns to the interval $(-\epsilon, \epsilon)$ by the Cauchy walk S_n is infinite.
- ▷ **Exercise 9.** Let $f : [0, 1] \rightarrow \mathbb{R}$ be a measurable function with $\int_0^1 |f(x)|^4 dx < \infty$, and let U_1, U_2, \dots be i.i.d. $\text{Unif}[0, 1]$ variables. Prove that $(f(U_1) + \dots + f(U_n))/n$ converges almost surely to $\int_0^1 f(x) dx$.

▷ **Exercise 10.*** Let X_1, X_2, \dots be iid variables with $\mathbf{E}X_i = \mu$ and $\text{Var}X_i = \sigma^2 < \infty$, and let $Z_n := \frac{X_1 + \dots + X_n - n\mu}{\sqrt{n\sigma}}$. Show that $\liminf_n Z_n = -\infty$ and $\limsup_n Z_n = \infty$ almost surely.

▷ **Exercise 11.** Flip a fair coin 60 times, and let $X \sim \text{Binom}(60, 1/2)$ be the number of heads. Using Markov's inequality for e^{tX} with the best possible t , which can be found by minimizing the convex function $f(t) = \log(1 + e^t) - \frac{5}{6}t$, show that

$$\mathbf{P}[|X - 30| \geq 20] \leq 2 \cdot 3^{60} \cdot 5^{-50} < 10^{-6}.$$

▷ **Exercise 12.** Prove that for any $\delta > 0$ there exist $c_\delta > 0$ and $C_\delta < \infty$ such that

$$\mathbf{P}[|\text{Poisson}(\lambda) - \lambda| > \delta\lambda] < C_\delta e^{-c_\delta\lambda},$$

for any $\lambda > 0$. (Hint: use the moment generating function of $\text{Poisson}(\lambda)$.)

▷ **Exercise 13.** Let $\xi_i \sim \text{Expon}(\lambda)$ i.i.d. random variables, and let $S_n := \xi_1 + \dots + \xi_n$. Prove that for any $\delta > 0$ there exist $c_\delta > 0$ and $C_\delta < \infty$ (also depending on λ , of course) such that

$$\mathbf{P}[|S_n - \mathbf{E}S_n| > \delta n] < C_\delta e^{-c_\delta n}.$$

Hint: use the moment generating function of Expon or the previous Poisson exercise!

▷ **Exercise 14.** Let $p, \alpha \in (0, 1)$ arbitrary, and let $\alpha_n \rightarrow \alpha$ such that $\alpha_n n \in \mathbb{Z}$ for every n . Using Stirling's formula, show that

$$\lim_{n \rightarrow \infty} \frac{-\log \mathbf{P}[\text{Binom}(n, p) = \alpha_n n]}{n} = \alpha \log \frac{\alpha}{p} + (1 - \alpha) \log \frac{1 - \alpha}{1 - p}.$$

When $\alpha = p$, we are getting that $\mathbf{P}[\text{Binom}(n, p) = \alpha_n n]$ is only subexponentially small. In particular, roughly how large is $\mathbf{P}[\text{Binom}(n, p) = \lfloor pn \rfloor]$?

The next bonus exercise contains some analytic details regarding the moment generating function. The main tool will be the *Dominated Convergence Theorem (DCT)*: if $\{X_n\}_{n \geq 1}$ and X and Y are random variables on the same probability space, with the almost sure pointwise convergence $\mathbf{P}[X_n \rightarrow X] = 1$, plus $|X_n| \leq Y$ holds almost surely for all n , where $\mathbf{E}Y < \infty$, then $\mathbf{E}|X_n - X| \rightarrow 0$, and thus $\mathbf{E}X_n \rightarrow \mathbf{E}X < \infty$.

- ▷ **Exercise 15.*** Assume that $m_X(t) := \mathbf{E}[e^{tX}] < \infty$ for some $t = t_0 > 0$, and let $\kappa_X(t) := \log m_X(t)$.
- (a) Show that $e^{tx} < 1 + e^{t_0 x}$ for all $0 \leq t \leq t_0$ and $x \in \mathbb{R}$. Deduce that $m_X(t) < \infty$ for all $0 \leq t \leq t_0$.
 - (b) Using part (a) and the DCT, show that if $t_n \rightarrow t$, all of them in $[0, t_0]$, then $m_X(t_n) \rightarrow m_X(t)$. Thus $m_X(t)$ and $\kappa_X(t)$ are continuous functions of $t \in [0, t_0]$.
 - (c) Show that $x < e^{tx}/t$ for any $t > 0$ and $x \in \mathbb{R}$. Deduce that $\mathbf{E}[Xe^{tX}] < \infty$ if $0 < t \leq t_0/2$.
 - (d) Using that $e^b - e^a = \int_a^b e^y dy$, show that $(e^{tx} - 1)/t \leq xe^{tx}$ for any $t > 0$ and $x \in \mathbb{R}$. Using part (c) and the DCT, show that $m'_X(0) = \mathbf{E}X < \infty$.
 - (e) Deduce that $\kappa'_X(0) = \mathbf{E}X$. Deduce that if $\alpha > \mathbf{E}X$, then $\kappa_X(t) - \alpha t < 0$ for some $t \in (0, t_0)$.

The goal of the final bonus exercise is to present one way to pass from $G(n, p)$ to the $G(n, M)$ model.

▷ **Exercise 16.*** Fix $\delta > 0$ arbitrary, and let $p_n \in (0, 1)$ and $M_n \in \{0, 1, \dots, \binom{n}{2}\}$ be two sequences satisfying $\binom{n}{2} p_n \rightarrow \infty$ and $(1 + \delta) \binom{n}{2} p_n < M_n$ for all n . Let $A_n \subset \{0, 1\}^{\binom{n}{2}}$ be a sequence of upward closed events such that $\mathbf{P}_{p_n}[A_n] \rightarrow 1$. Prove that $\mathbf{P}[G(n, M_n) \text{ satisfies } A_n] \rightarrow 1$, as $n \rightarrow \infty$.

In more detail:

- (a) Show that $\mathbf{P}[\text{Binom}(\binom{n}{2}, p_n) < M_n] \rightarrow 1$.
 - (b) Let \mathcal{E}_n denote the number of edges in $G(n, p)$. Deduce from part (a) that $\mathbf{P}_{p_n}[A_n \mid \mathcal{E}_n < M_n] \rightarrow 1$.
 - (c) Show that, for any $M \in \{0, 1, \dots, \binom{n}{2}\}$, we have $\mathbf{P}_{p_n}[A_n \mid \mathcal{E}_n = M] = \mathbf{P}[G(n, M) \text{ satisfies } A_n]$.
 - (d) Deduce from part (c) that $\mathbf{P}_{p_n}[A_n \mid \mathcal{E}_n < M_n] \leq \mathbf{P}[G(n, M_n) \text{ satisfies } A_n]$.
- Combining parts (b) and (d) concludes the exercise.
