

The problems with an asterisk are the ones that you are supposed to submit. The ones with two asterisks are meant as more challenging, and by solving them you can earn extra credit.

1. We call a subset  $X$  in a topological group  $G$  *symmetric*, if  $X^{-1} = X$ . Show that the symmetric neighbourhoods of the identity element  $1_G$  of  $G$  form a neighbourhood basis of  $1_G$ .
2. \* (Tube lemma) Let  $X$  be an arbitrary,  $Y$  a compact topological space,  $x_0 \in X$  an arbitrary point,  $N \subseteq X \times Y$  an open subset containing  $\{x_0\} \times Y$ . Prove that there exists an open neighbourhood  $W$  of  $x_0$  in  $X$  such that  $N \supseteq W \times Y$ .
3. Consider a set  $X$ , and two topologies  $\tau, \tau'$  on  $X$ . Show that if both  $(X, \tau)$  and  $(X, \tau')$  are both compact Hausdorff, then  $\tau$  and  $\tau'$  are not comparable (as subsets of  $2^X$ ).
4. \* Take two disjoint compact subspaces  $F, G \subseteq X$ , where  $X$  is Hausdorff. Prove that there exist disjoint open sets  $U, V \subseteq X$  for which  $F \subseteq U$  and  $G \subseteq V$ .
5. \*\* Let  $X$  be a non-empty compact Hausdorff space with no isolated points. Show that  $X$  must be uncountable.
6. Prove that a connected metric space with more than one point is uncountable.

**Definition.** Let  $X$  be a topological space,  $x \in X$ . We say that  $X$  is *locally compact at  $x$* , if there exists a compact subset  $C \subseteq X$  which contains a neighbourhood of  $x$ . The space  $X$  is called *locally compact* if it is locally compact at every one of its points.

7. Prove that  $\mathbb{R}^n$  is locally compact, but  $\mathbb{Q}$  is not.
8. Let  $X$  be a second countable topological space,  $A \subseteq X$  an uncountable set. Verify that uncountably many point of  $A$  are limit points of  $A$ .
9. \*\* Let  $\phi : A \rightarrow B$  be a homomorphism of commutative rings (all rings in this course have 1).
  - (1) Prove that the function  $\tilde{\phi} : \text{Spec } B \rightarrow \text{Spec } A$  defined as
 
$$\tilde{\phi}(P) \stackrel{\text{def}}{=} \phi^{-1}(P)$$
 is a well-defined continuous function.
  - (2) If  $\phi$  is a surjective homeomorphism, then  $\tilde{\phi}$  is a homeomorphism of  $\text{Spec } B$  onto the closed subset  $V(\ker \phi) \subseteq \text{Spec } A$ .
  - (3) If  $\phi$  is injective, then  $\tilde{\phi}(\text{Spec } B) \subseteq \text{Spec } A$  is a dense subset.
10. \*\* Let  $A$  be a commutative Boolean ring (ie. one in which  $a^2 = a$  for every element  $a \in A$ ). Show that  $\text{Spec } A$  is a compact Hausdorff space.
11. For  $X, Y$  arbitrary topological spaces, prove that the projection maps  $\pi_1 : X \times Y \rightarrow X$  and  $\pi_2 : X \times Y \rightarrow Y$  are open maps.
12. Show that if  $A \subseteq X, B \subseteq Y$ , then  $\overline{A \times B} = \overline{A} \times \overline{B}$  as subsets of  $X \times Y$ .
