LECTURER: Dániel Prokaj

Probability Theory 2nd midterm, 25th November 2021.

Working time: 45 minutes. Only simple, non-programmable calculators are allowed.

Maximum score: 24 points, but we consider 20 points already as 100%.

1. In a fantasy themed videogame we have 3 cards: a hobbit, an elf, and a dwarf. The damage that one card deals in combat follows a normal distribution with expected value 30 and standard deviation 4, independently of the other cards. We face a dragon, whose health is totally independent from our cards and follows a normal distribution with expected value 100 and standard deviation 4. To beat the dragon, we need the total damage of our cards to be bigger than the health of the dragon. What is the probability that we beat the dragon? Use the standard normal table at the back page. (7 points)
2. The joint distribution of (X, Y) is uniform on the parallelogram with nodes $(0, 0); (1, 0); (2, 1); (1, 1)$. Calculate the marginal density function of X . (6 points)
3. 30 people are playing rock-paper-scissors with the following rules. They form a big circle and choose a hand (rock, paper, or scissors, they choose each with probability $\frac{1}{3}$) at the same time, independently of each other. Then everyone compares his own choice to both of his neighbours'. The winner is decided in the well-known way: rock beats scissors, scissors beats paper, paper beats rock. The winner gains a coin from the loser, but nothing happens if they tie. For instance, if you beat one of your neighbours in rock-paper-scissors and tie with the other, you gain 1 coin; if you win against one of your neighbours and lose against the other, then you gain 0 coins. Write ξ for the number of players that gain 2 coins. $\mathbb{E}\xi = ?$ (7 points)

Bonus: Consider the random variable ξ defined in the previous exercise and calculate its variance. (4 points)
